

Today a large number of traveling public (look at the waiting area in any large airport) use cell phones for business and personal reasons. Unfortunately, many users do a very poor job of keeping their voice down in volume when on a cell phone. In the confined space of an airplane cabin with a large number of business and on vacation travellers, there would be high cell use. The noise level from multiple conversations would be very disruptive to others particularly when coupled with other existing cabin and aircraft noise. Also, there is no place within the cabin to find a quiet place for those who want to sleep, read, do work, etc. Allow a broadband interface to their laptops for those who feel a need to communicate to the ground. Laptop keys don't make much noise!
